Dynamic Network Theory How Social

This analysis is made possible through a powerful combination of approaches from social psychology, industrial/organizational psychology, organization/management science, social learning, and helping skills. Dynamic Network Theory is a quantum advance over conventional approaches because it directly infuses goals into social network analyses. Reaching beyond past research, the author also shows how the new concepts of "network motivation" and the "network

Dynamic Network Theory is a quantum advance over conventional social network analysis. Reaching beyond the mere mapping of connections among a network's nodes of individuals and organizations, the author examines the various entities of social networks, how to assess the net valence of their roles, and the systemic environments that influence those roles.

Dynamic network theory states that people use various judgement and decision-making processes that activate each social network role (or multiplex combination of the roles). This then impacts important emergent outcomes in dynamic network systems, such as performance, emotional reactions, and climates.

There are three main features to dynamic network analysis that distinguish it from standard social network analysis. First, rather than just using social networks, DNA looks at meta-networks. Second, agent-based modeling and other forms of simulations are often used to explore how networks evolve and adapt as well as the impact of interventions on those networks.

Dynamic network theory uniquely posits how goal achievement influences emotions in social networks. In particular, according to the network rippling of emotions process in the theory, when goals are achieved, the goal strivers are predicted to have positive emotional reactions, consistent with traditional

Overview of Dynamic Network Theory - Beyond Intractability

The theory ties social networks to goal nodes through a parsimonious set of social network role linkages, such as independent goal striving, system supporting, feedback, goal preventing, supportive resisting, and system negating (i.e., those who are upset with others in the pursuit).

Westaby, James (jdw43) | Teachers College, Columbia University

This book brings social influence network theory to bear on lines of research in the domain of small group dynamics concerned with changes of group members' positions on an issue, including the formation of a consensus and of settled disagreement, via endogenous interpersonal influences, in which group members are responding to the displayed positions of the members of the group.

A good theory to explain how (social) networks grow is the percolation theory, which describes how connections in any network develop through the paths of least resistance: the network then becomes the product of the resource constraints the environment places on it (Newman, & Watts, 1999).
