Suppose $d \mid a$ and $d \mid b$, so there exist integers c_1 and c_2 such that $dc_1 = a$ and $dc_2 = b$. Then $b - a = dc_2 - dc_1 = d(c_2 - c_1)$, so $d \mid b - a$. Thus $\gcd(a, b) \leq \gcd(a, b - a)$, since the set over which we are taking the max for $\gcd(a, b)$ is a subset of the set for $\gcd(a, b - a)$.

One of the most important tools in elementary number theory is modular arithmetic (or congruences). Suppose a , b and m are any integers with m not zero, then we say a is congruent to b modulo m if m divides $a - b$. We write this as $a \equiv b \pmod{m}$.

The systematic study of number theory was initiated around 300 B.C. when Euclid proved that there are infinitely many prime numbers. At the same time, he also cleverly deduced the fundamental theorem of arithmetic, which asserts that every positive integer factors uniquely as a product of primes.
