This new edition of Guidelines for Electrical Transmission Line Structural Loading (Manual 74) has been prompted by the need to introduce several major changes to the most recent Manual 74 (1991), as well as to have an opportunity to better define or refine some of the minor issues addressed

Guidelines for Electrical Transmission Line Structural Loading

Because transmission of electrical current is normally at higher voltages (69 kV and above), conductors must be larger in diameter and span lengths must be longer than in normal distribution.

Guidelines For The Construction And Maintenance Of ...

The transmission line is kept in the centre of right of way (ROW). The right of way clears all trees, structure and construction which interference the power lines. The maximum width of ROW is calculated by considering transmission line voltage, wind speed, sag, tower design, swing and other safety consideration.
