Most often, using `import java.sql.*` will suffice. Register the JDBC driver: Requires that you initialize a driver so you can open a communication channel with the database. Open a connection: Requires using the `DriverManager.getConnection()` method to create a `Connection` object, which represents a physical connection with the database. Execute a query: Requires using an object of type `Statement` for building and submitting an SQL statement to the database.

For the entire Java application, the JDBC driver is registered only once per each database that needs to be accessed. This is true even when there are multiple database connections to the same data server. Alternatively, the `forName ()` method of the `java.lang.Class` class can be used to load and register the JDBC driver:
