to dead and live loads usually does not impose any particular challenge, their design for potential seismic or wind load requires more careful investigation. This is due to the fact that the service life of a temporary structure is much shorter than a “permanent structure,” and as such, the probability of load exposure to the temporary structure is substantially

More recent studies , that have included combined effects of earthquake and wind loads in the time domain have highlighted the importance of earthquake loading in the design of wind turbines. Considering the rather low natural frequencies of OWTs (around 0.3 Hz), these structures are generally not vulnerable to horizontal earthquake
