Download Thermodynamics And Heat Transfer Solution - 610 Chapter 20 The First Law of Thermodynamics Therefore, the rate of energy transfer by conduction through the rod is $P = \frac{kA\Delta T}{L}$ (2016) For a compound slab containing several materials of thicknesses $L_1, L_2,$ and thermal conductivities $k_1, k_2,$, the rate of energy transfer through the slab at steady state is $P = \frac{A\Delta T}{\frac{L_1}{k_1} + \frac{L_2}{k_2}}$

The Second Law of Thermodynamics implies that heat will not transfer from a colder to a hotter body without some external source of energy. Conduction involves the transfer of heat by the interactions of atoms or molecules of a material through which the heat is being transferred.

Barriers to Efficient Heat Transfer Heat energy is transferred on the virtue of temperature difference. So, when there are two bodies, with different temperatures in contact with each other, heat transfer will take place from body at higher temperature to the body at lower temperature until the temperatures of both the bodies become the same.

This transfer of heat from a hot object to a cooler one obeys the first law of thermodynamics: energy is conserved. Now consider the same process in reverse. Suppose that a hot frying pan in a sink of cold water were to become hotter while the water became cooler.
